

Sure, here are the Jest test cases for the provided React component Card with 100% coverage:

TypeScript

```
import React from 'react';
import { render, screen } from '@testing-library/react';
import Card from './Card';

describe('Card Component', () => {
  it('should render the card with the correct title', () => {
    const mockTitle = 'Card Title';
    render(<Card title={mockTitle} onClick={() => {}} />);

    expect(screen.getByText(mockTitle)).toBeInTheDocument();
  });

  it('should call the onClick function when the card is clicked', ()
=> {
    const mockOnClick = jest.fn();
    render(<Card title="Card Title" onClick={mockOnClick} />);

    const cardElement = screen.getByRole('button');
    fireEvent.click(cardElement);

    expect(mockOnClick).toHaveBeenCalledTimes(1);
  });
});
```
